SYSTEM FOR MONITORING THE USAGE OF INTRANET
PORTAL MODULES

ABSTRACT OF THE DISCLOSURE

A module-based Intranet portal is monitored to determine the usage of the modules of the Intranet portal. Detailed information relating to the usage of a module by a user is recorded and stored in a database. A user can then retrieve the detailed information on module usage from the database. The retrieved information is displayed in a chart or table for the user and includes information on the number of users of the module, the number of hits for the module, the number of times the module has been added to a user's portal and the number of times the module has been removed from the user's portal. In addition, the retrieved information can be sorted or arranged in the chart based on a number of different criteria. The different criteria for sorting the retrieved information includes the community of the user, the browser of the user, the country of the user, the index page of the user, the location of the user, the manager of the user and the operating system of the user.
